

• Para una carga triangular:  

$$F_R = \frac{1}{2} (5m)(10 \frac{KN}{m}) = 25 KN$$

$$d = \frac{2}{3}(5m) = \frac{10}{3}m$$

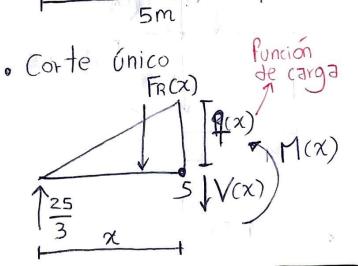

• Hacemos 
$$\sum Fy = 0$$
  
 $0 = Ay + By - FR$   
 $Ay = FR - By = 25 - \frac{50}{3}$   
 $Ay = \frac{25}{3} KN T$ 

• La viga se soluciona con un único corte a una distancia 
$$x$$
, pero no necesitamos determinar la función  $M(x)$  para  $0 \le x \le 5$ , sino el valor de  $M(1.5)$ .

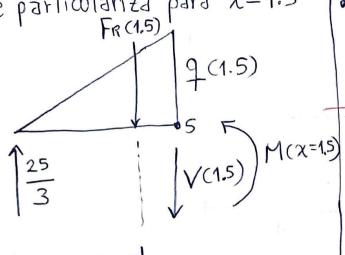

D.C.L. Final

25 KN

2

o Se particulariza para x=1.5

d(1.5)
1.5m

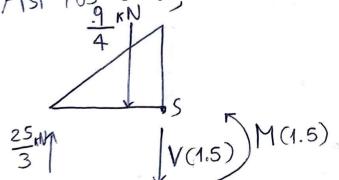

(alwigndo 9(1.5)

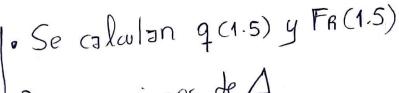

$$\frac{9(1.5)}{1.5m} = \frac{10 \frac{kN}{m}}{5}$$

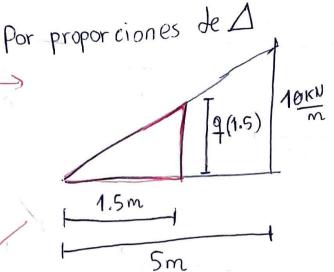

$$9(1.5) = 3\frac{kN}{m}$$

 $d(1.5) = \frac{2}{3}(1.5) = 1m$ Punto de aplicación

Así las cosas,

Luego FR (1.5) es el area del triángulo rojo.

$$\frac{1.5m}{1.5m} = \frac{3 \frac{kN}{m}}{F_R(1.5)} = \frac{1.5m(3 \frac{kN}{m})}{2}$$

$$FR(1.5) = \frac{9}{4} KN$$

· Hacemos ZM=en S:

$$0 = M(1.5) + \frac{9}{4}(0.5) - \frac{25}{3}(1.5)$$

$$M(1.5) = \frac{25}{3}(1.5) - \frac{9}{4}(0.5)$$

> El momento flector en x = 1.5 m
